1 Scenarios

The base case analysis assumes a prior distribution for 5-year OS given by normal prior with central 95% density contained within the range (20% to 55%); this distribution has mean `0.375` and variance `0.0079719`. We consider five additional scenarios:

- Scenario 1: Variance halved
- Scenario 2: Variance doubled
- Mean decreased by 20%, same variance
- Mean decreased by 20%, variance halved
- Mean decreased by 20%, variance doubled

For all scenarios, we compare mean lifetime OS and 5-year landmark OS, as before.

Table 1: Mean OS for Scenarios 1 through 5, including comparisons with base case (probabilistic mean difference and variance ratio)
